

Lowering Microsoft Security in Outlook & Express

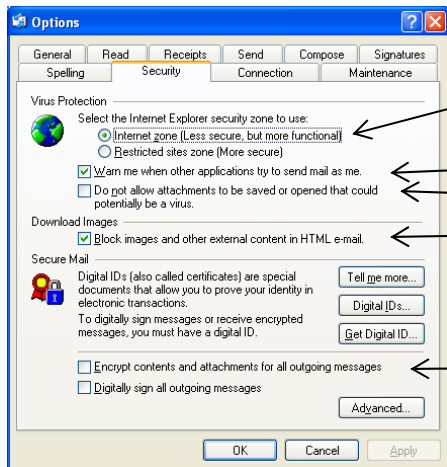

When downloading Microsoft updates the new security patches often change the settings in Internet Explorer and Outlook/Express to increase security. This can be a problem as the new settings are often too high and block information people want.

To lower the security:

Open Internet Explorer and Click the Tools menu and then select Internet Options:

Next
Select the Security Tab

Select the Internet Zone

Deselect
Warn...
Do not ...
Block ...

Leave these unselected

Note that you may also need to set your Internet security levels.
